T. Peyrin, Y. Seurin

Counter-in-Tweak

CRYPTO 2016 1 / 32

• starting point: CAESAR competition for Authenticated Encryption (AE)

- more precisely, candidates Deoxys, Joltik and KIASU (Jean, Nikolic, Peyrin)
- each is based on a tweakable block cipher (Deoxys-BC, Joltik-BC, or KIASU-BC) and two modes of operation:
  - OCB for the nonce-respecting setting
  - COPA for the nonce-misuse setting
- problems with COPA:
  - provides only online nonce-misuse resistance [FFL12, HRRV15
  - for fractional messages, relied on XLS which has been broken [Nan14]

T. Peyrin, Y. Seurin

# Building Block: Tweakable Block Ciphers (TBCs)

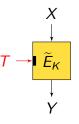

- tweak T: brings variability to the block cipher
- T assumed public or even adversarially controlled
- each tweak should give an "independent" permutation
- few "natively tweakable" BCs:
  - Hasty Pudding Cipher [Sch98]
  - Mercy [Cro00
  - Threefish [FLS<sup>+</sup>10]
  - CAESAR proposals KIASU, Deoxys, Joltik, (i)SCREAM,
     Minalpher

## Goal: Nonce-Based Authenticated Encryption (nAE)

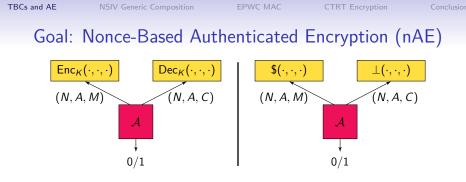

#### Syntax

A nAE scheme  $\Pi$  is a pair of algorithms ( $\Pi.Enc,\Pi.Dec)$  where

- algorithm Π.Enc takes
  - (a key *K*)
  - a nonce N
  - associated data A
  - a message M

and returns a ciphertext C.

• algorithm  $\Pi$ . Dec takes K and (N, A, C) and returns M or  $\bot$ .

#### Security (all-in-one definition)

- The scheme  $\Pi$  is secure if adversary  $\mathcal{A}$  cannot distinguish  $(Enc_{\mathcal{K}}, Dec_{\mathcal{K}})$  and  $(\$, \bot)$ .
- *A* cannot ask a decryption query (*N*, *A*, *C*) if it received *C* from an encryption query (*N*, *A*, *M*)
- *A* is said nonce-respecting if it never repeats a nonce in encryption queries.

#### Misuse-Resistant AE (MRAE)

#### Nonce-misuse resistance (informal) [RS06]

A nAE scheme is said nonce-misuse resistant if repeating a nonce in encryption queries:

- does not harm authenticity
- hurts confidentiality only insofar as repetitions of triplets (N, A, M) are detectable

- $\simeq$  deterministic authenticated encryption
- MRAE schemes *cannot* be online (each ciphertext bit must depend on each input bit)

Counter-in-Tweak

CRYPTO 2016 10 / 32

#### Generic Composition

Starting from two building blocks:

- a MAC (or a PRF)  $F_{\mathcal{K}_1}(\cdot,\cdot,\cdot)$
- an encryption scheme  $\mathsf{Enc}_{\mathcal{K}_2}(\cdot,\cdot)$

combine them to obtain a nAE scheme [BN00, NRS14].

Two types of encryption schemes:

(random) IV-based encryption (ivE):
 C = Enc<sub>K2</sub>(IV, M), IV randomly chosen by the encryption oracle (ex: CBC)

 nonce-based encryption (nE):
 C = Enc<sub>K2</sub>(N, M), N chosen by the adversary but non-repeating (ex: nonce-based CTR mode, GCM)

#### Security Result for NSIV

#### Theorem

For any adversary  $\mathcal{A}$  against NSIV[ $F, \Pi$ ],

 $\mathsf{Adv}^{\mathrm{nAE}}_{\mathsf{NSIV}}(\mathcal{A}) \leq \mathsf{Adv}^{\mathrm{nivE}}_{\Pi}(\mathcal{A}') + \mathsf{Adv}^{\mathrm{nPRF}}_{\mathcal{F}}(\mathcal{A}'') + \mathsf{Adv}^{\mathrm{nMAC}}_{\mathcal{F}}(\mathcal{A}''').$ 

Moreover, if A repeats any nonce at most m times, then A', A'', and A''' also repeat any nonce at most m times.

T. Peyrin, Y. Seurin

Counter-in-Tweak

#### Instantiating F and $\Pi$

#### Remaining of the talk:

How to instantiate the PRF F and the nivE encryption scheme  $\Pi$  from a TBC  $\widetilde{E}$  so that

- we get BBB-security in the nonce-respecting setting
- we retain birthday-bound security in the nonce-misuse setting

#### Security of EPWC

#### Theorem

Let  $\mathcal{A}$  be an adversary against EPWC with an ideal TBC with block-length n making at most q queries. Then

(a) If A is nonce-respecting,

$$\mathsf{Adv}^{\mathrm{nPRF}}_{\mathsf{EPWC}}(\mathcal{A}) \leq \mathcal{O}\left(rac{q}{2^n}
ight), \qquad \mathsf{Adv}^{\mathrm{nMAC}}_{\mathsf{EPWC}}(\mathcal{A}) \leq \mathcal{O}\left(rac{q}{2^n}
ight)$$

(b) If A is allowed to repeat nonces, then

$$\mathsf{Adv}^{\mathrm{PRF}}_{\mathsf{EPWC}}(\mathcal{A}) \leq rac{q^2}{2^n}, \qquad \mathsf{Adv}^{\mathrm{MAC}}_{\mathsf{EPWC}}(\mathcal{A}) \leq rac{q^2+q}{2^n}.$$
